

REORDERING SONGS

Good - Spotify: Good contrast

Better UX since the three bars on the left to reorder songs has good contrast.

User chooses the playlist they want to edit

Once user is in the playlist, they click on the three dots across from the back button at the top of the playlist

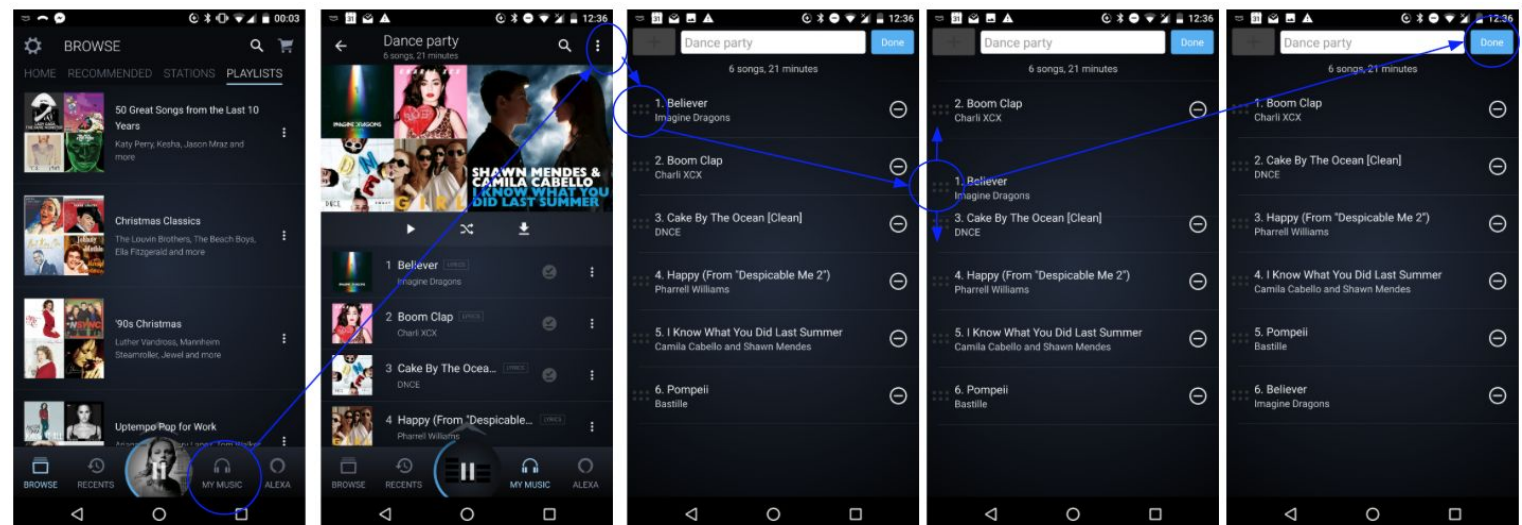

A menu will show up that will allow user to edit the playlist

User uses the three lines symbol on the right of the song title and drags that up and down to move the song

User has moved the song down one spot

Less Good - Amazon Music: Low contrast

Less good since the 6 dots on the left has low contrast and does not really pass the squint test

Go to your music to and find the playlist you want to re-order

Once in the playlist page, they click on the three dots on the top right of the screen

Find the 6 dot on the left of every song.

Click on the 6 dots and drag the song up or down to put the song(s) in the order that you prefer.

Once you are satisfied with the results, then click the "Done" button on the top right.
